

# MOODY

From Manual Identification to  
Automated Access:

**FACIA's**  
Solution for Warehouse  
Access Management  
System

# CASE STUDY

## Introduction of Moody

MOODY is a company that provides logistics services to various industries. With their expanding business, they needed an efficient way to manage their warehouses and ensure the safety of their products. But, with so many individuals coming in and out of the warehouse on a regular basis, it became difficult to check IDs and prevent fraud. MOODY required a trustworthy solution to combat these problems.

### MOODY CEO

"We were facing significant challenges in managing the security of our warehouses due to extensive people accessing them. Facia's customized solution helped us overcome unauthorized access challenges and provided us with an efficient warehouse management system."

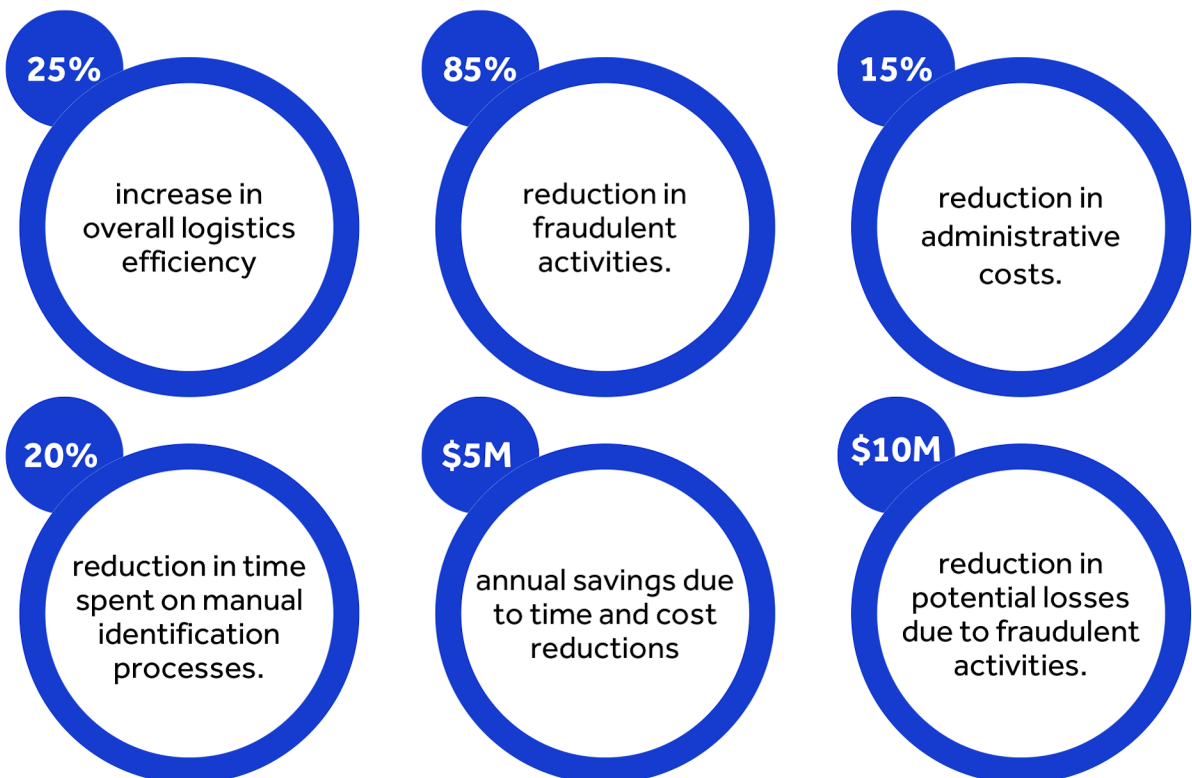

## Challenge:

As a result of the constant influx of new visitors, the warehouse's security became a major issue for MOODY. It was critical for MOODY to have a robust system that verified everyone who entered the warehouse at various checkpoints. MOODY required a system where access to restricted locations was granted or denied based on a user's specific clearance level at the checkpoints.

## Solution:

Facia, a leader in facial recognition technology that includes liveness detection, took the initiative to provide a reliable warehouse access management solution for MOODY. The Facia technology was adapted to deliver customized security according to individual clearances. The system was created so that only authorized individuals can enter the warehouse once their identities are checked and verified.

## Results:

## What did Facia offer?

Facia's system for identifying people by their faces is highly sophisticated, able to take a photo of a person and verify their identification in a few seconds. The liveness detection feature ensures that only real individuals can access the warehouse. As the system is programmed to distinguish people by their facial traits, it can help to identify people even if they alter their appearance or put on a mask.

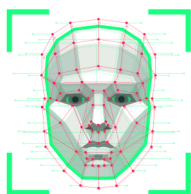

**FACIA's** solution for MOODY's warehouse management system included the following features:

### Customized Clearance Levels:

The Facia solution was tailored to offer security based on clearance levels in each sector. By doing so, MOODY could restrict access to sensitive warehouse portions, allowing only authorized staff to enter such areas.

### FR With Liveness Detection:

MOODY identified each person entering the warehouse using Facia's FRT with liveness detection. The system ensured that only real individuals were granted access to the warehouse, preventing fraudulent activities.

## Secure Database:

Facia's solution provided a secure database to store and manage individuals' data. It was encrypted to protect the privacy of the information stored in the database to thwart spoof and malicious activities.

## Real-time Tracking:

Facia's solution allowed for real-time monitoring of who entered and left the warehouse. Hence, MOODY could monitor employees' whereabouts, spot security breaches & react swiftly to prevent further damage.

## Easy-to-use Dashboard:

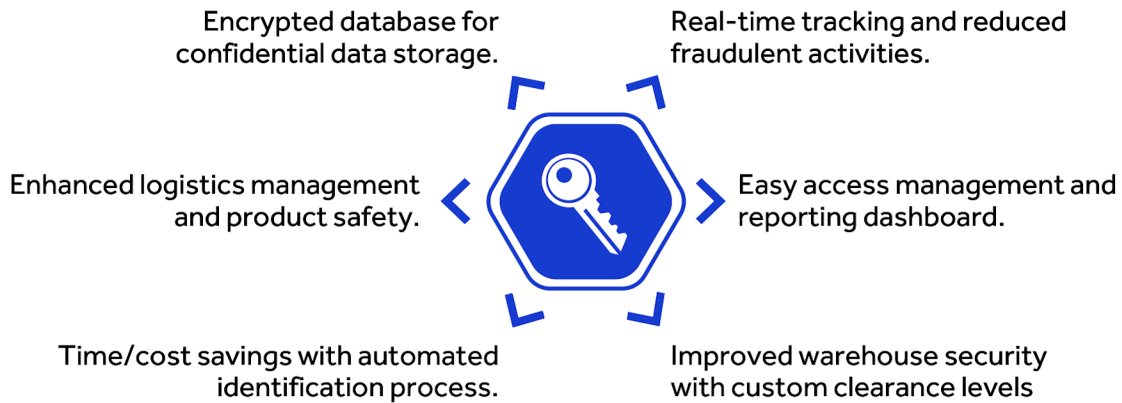

Facia provided a user-friendly dashboard to monitor user activity. It gave MOODY access to real-time information about people's movements inside the warehouse, enabling them to spot possible security breaches.

## Results:

With Facia's customized solution, MOODY was able to improve the security of its warehouses significantly. The system allowed them to track individuals' movements, grant access only to authorized persons, and prevent fraudulent activities. The real-time tracking and reporting features allowed them to identify potential security breaches and take immediate action. The system also helped MOODY to save time and reduce administrative costs associated with manual identification processes.

# Key-Takeaways

**Mujadad Naeem**  
CEO & CTO Facia

“ We are delighted to have helped MOODY overcome their security challenges with our facial recognition system with liveness detection. Our solution is designed to provide enhanced security, convenience, and efficiency to our clients, and we are proud to have delivered the same to MOODY.” ”

Facia's facial recognition system with liveness detection provided MOODY with an efficient warehouse access management system that helped them overcome the security challenges of multiple people accessing their warehouses daily. Our features provided enhanced security, while the easy-to-use dashboard made it convenient to manage access and generate reports.
